Second Preliminary Amendment

Docket No.: 209593-100877

ABSTRACT

A mirror supporting plate for supporting a mirror glass of a wing mirror for a motor vehicle includes a substantially flat support provided with a substantially rod-shaped actuator part for coupling with a drive. The actuator part is integrally formed with the support and is adjustable relative to the support from a first position in which the actuator part is oriented substantially in or along the plane of the support, to a second position in which the actuator part is oriented so as to reach substantially outwards relative to the support.
